Minimum distance classifier matlab code

minimum distance classifier matlab code is a fundamental technique in pattern recognition and machine learning used to classify data points based on their proximity to predefined class centroids. This approach is simple, efficient, and widely applicable, especially for small to medium-sized datasets where computational simplicity is desired. Implementing a minimum distance classifier in MATLAB involves calculating the Euclidean or other distance metrics between a test data point and each class centroid, then assigning the point to the class with the smallest distance. This article provides a comprehensive guide to understanding, designing, and optimizing minimum distance classifiers in MATLAB, complete with example code snippets, best practices, and tips for improving classification accuracy.

Understanding the Minimum Distance Classifier

What is a Minimum Distance Classifier? A minimum distance classifier assigns a data point to the class whose prototype (or centroid) is closest to it in the feature space. The core idea is straightforward: for each class, compute a representative point (center), then measure the distance from the test point to each center, and select the class with the minimum distance.

Key points: It assumes that data points

belonging to the same class are clustered around a centroid. It is a type of instance-based learning technique. Primarily based on distance metrics like Euclidean distance.

Why Use a Minimum Distance Classifier?

This classifier is popular because of its simplicity and speed. Its advantages include:

- Easy to implement in MATLAB.
- Computationally efficient for small datasets.
- No need for complex model training.
- Suitable for real-time applications where quick classification is required.

However, it also has limitations, such as sensitivity to outliers and poor performance with overlapping classes in high-dimensional spaces.

Implementing Minimum Distance Classifier in MATLAB

Step-by-step Process

Implementing a minimum distance classifier involves several key steps:

- Data Preparation:** Organize your dataset into features and labels.
- Compute Class Centroids:** Calculate the mean of each class.
- Distance Calculation:** For each test point, compute the distance to each centroid.
- Classification:** Assign the test point to the class with the smallest distance.
- Evaluation:** Measure the classifier's performance using metrics such as accuracy.

Sample MATLAB Code

Below is a basic implementation of a minimum distance classifier in MATLAB:

```
%% matlab
% Sample dataset
% Features matrix (rows: samples, columns: features)
trainData = [1.2, 3.4; 2.1, 3.8; 5.0, 7.2; 6.1, 8.0];
trainLabels = [1; 1; 2; 2]; % Corresponding class labels
% Test data
testData = [1.5, 3.5; 5.5, 7.5];
% Unique classes
classes = unique(trainLabels);
% Compute class centroids
centroids = zeros(length(classes), size(trainData, 2));
for i = 1:length(classes)
    classData = trainData(trainLabels == classes(i), :);
    centroids(i, :) = mean(classData, 1);
end
% Initialize predicted labels
predictedLabels = zeros(size(testData, 1), 1);
% Classify each test point
for i = 1:size(testData, 1)
    distances = zeros(length(classes), 1);
    for j = 1:length(classes)
        distances(j) = norm(testData(i, :) - centroids(j, :)); % Euclidean distance
    end
    [~, minIdx] = min(distances);
    predictedLabels(i) = classes(minIdx);
end
% Display results
disp('Test Data Predictions:');
disp(predictedLabels);
```

This code demonstrates a basic implementation and can be extended for larger datasets, multiple features, and more sophisticated distance metrics.

Optimizing the Minimum Distance Classifier in MATLAB

Key Techniques for Optimization

To enhance the performance and accuracy of your minimum distance classifier in MATLAB, consider the following optimization strategies:

- Feature Scaling and Normalization:** Ensures that all features contribute equally to the distance calculation. Use MATLAB functions like `normalize()` or `zscore()`.
- Choosing the Right Distance Metric:** While Euclidean distance is common, alternatives include Manhattan, Chebyshev, or Mahalanobis distances. MATLAB's `pdist2()` function supports various metrics.
- Dimensionality Reduction:** Techniques like PCA can reduce the feature space, improving classifier robustness. Use MATLAB's `pca()` function.
- Handling Outliers:** Outliers can skew centroids. Use robust statistics or remove outliers before training.
- Batch Processing:** Vectorize code to process multiple test points simultaneously, improving speed.

Enhanced MATLAB Implementation with Vectorization

Here's an optimized, vectorized version of the classifier:

```
%% matlab
% Assuming trainData, trainLabels, and testData are already defined
% Calculate centroids
classes = unique(trainLabels);
centroids = zeros(length(classes), size(trainData, 2));
for i = 1:length(classes)
    centroids(i, :) = mean(trainData(trainLabels == classes(i), :));
end
% Compute distances between all test points and each centroid
distances = pdist2(testData, centroids, 'euclidean');
% Assign labels based on minimum distance
[~, minIdx] = min(distances, [], 2);
predictedLabels = classes(minIdx);
disp('Predicted labels for test data:');
disp(predictedLabels);
```

This approach leverages MATLAB's `pdist2()` function for

efficient distance calculation and vectorized operations for classification, significantly reducing runtime for larger datasets. Applications of Minimum Distance Classifier in MATLAB Understanding the versatility of this classifier can inspire its application across different domains: Image Recognition Classifying images based on feature vectors extracted from images. Minimum Distance Classifier MATLAB Code is a fundamental algorithm in pattern recognition and machine learning, often utilized for classification tasks where the goal is to assign data points to predefined classes based on their features. Implementing this classifier in MATLAB offers a straightforward and efficient approach for students, researchers, and practitioners to understand the core concepts of distance-based classification and quickly apply them to real-world datasets. The minimum distance classifier operates on a simple principle: it assigns a new data point to the class whose mean (or centroid) is closest in terms of a specified distance metric, usually Euclidean distance. This simplicity, combined with MATLAB's powerful matrix operations and visualization capabilities, makes it an attractive choice for educational demonstrations and small-scale classification problems. Understanding the Minimum Distance Classifier Before diving into MATLAB code, it's important to grasp the conceptual foundation of the minimum distance classifier. Essentially, it is a type of prototype-based classifier where each class is represented by a prototype, typically the mean vector of the training samples belonging to that class. When a new sample is

introduced, the classifier calculates the distance from this sample to each class prototype and assigns it to the class with the smallest distance. Key features: Simple to implement and interpret. Computationally efficient for small to medium-sized datasets. Suitable for linearly separable data but can be extended with more complex distance measures. Limitations: Sensitive to outliers, since the class mean can be skewed. Assumes classes are roughly spherical and equally distributed. Not suitable for high-dimensional data without feature selection or dimensionality reduction.

Implementing the Minimum Distance Classifier in MATLAB

The process of implementing a minimum distance classifier in MATLAB typically involves several core steps: Data Preparation, Calculating Class Means, Classifying New Data Points, Evaluating Performance. Let's examine each step in detail.

1. Data Preparation

First, you need a dataset with labeled training samples. For demonstration, consider a simple two-class dataset:

```
matlab% Sample training data (features and labels)
trainData = [randn(50,2) + 2; randn(50,2) - 2];
trainLabels = [ones(50,1); zeros(50,1)];
```

In this example, two classes are generated from different Gaussian distributions. For testing purposes, generate some test data:

```
matlab% Test data
testData = [randn(10,2) + 2; randn(10,2) - 2];
testLabels = [ones(10,1); zeros(10,1)];
```

Ensure that data is properly scaled if necessary, especially for high-dimensional datasets.

2. Calculating Class Means

Compute the mean vector for each class:

```
matlab% Separate data by class
class1Data = trainData(trainLabels==1,:);
class2Data = trainData(trainLabels==0,:);
% Calculate means
meanClass1 = mean(class1Data);
meanClass2 = mean(class2Data);
```

These mean vectors serve as the prototypes for each class.

3. Classifying New Data Points

For each test sample, compute the Euclidean distance to each class mean:

```
matlab% Initialize predicted labels
predictedLabels = zeros(size(testData,1),1);
% Loop over test data
for i = 1:size(testData,1)
    distToClass1 = norm(testData(i,:) - meanClass1);
    distToClass2 = norm(testData(i,:) - meanClass2);
    % Assign to the closest class
    if distToClass1 < distToClass2
        predictedLabels(i) = 1;
    else
        predictedLabels(i) = 0;
    end
end
```

Alternatively, vectorized implementation can improve efficiency:

```
matlab% Vectorized computation
distToClass1 = sqrt(sum((testData - meanClass1).^2, 2));
distToClass2 = sqrt(sum((testData - meanClass2).^2, 2));
predictedLabels = distToClass1 < distToClass2;
```

4. Performance Evaluation

Compare predicted labels with actual labels:

```
matlab% Calculate accuracy
accuracy = sum(predictedLabels == testLabels) / length(testLabels) * 100;
fprintf('Classification Accuracy: %.2f%%\n', accuracy);
```

Below is a complete, annotated MATLAB code implementing the minimum distance classifier:

```

trainData = [randn(50,2) + 2; randn(50,2) - 2];

% Generate sample test data
testData = [randn(10,2) + 2; randn(10,2) - 2];
testLabels = [ones(10,1); zeros(10,1)];
% Calculate class means
class1Data = trainData(trainLabels==1, :);
class2Data = trainData(trainLabels==0, :);
meanClass1 = mean(class1Data);
meanClass2 = mean(class2Data);
% Classify test data
distToClass1 = sqrt(sum((testData - meanClass1).^2, 2));
distToClass2 = sqrt(sum((testData - meanClass2).^2, 2));
predictedLabels = distToClass1 < distToClass2;
% Evaluate accuracy
accuracy = sum(predictedLabels == testLabels) / length(testLabels) * 100;
fprintf('Minimum Distance Classifier Accuracy: %.2f%%\n', accuracy);
% Plotting for visualization

% Plot training data
scatter(class1Data(:,1), class1Data(:,2), 'ro', 'DisplayName', 'Class 1');
scatter(class2Data(:,1), class2Data(:,2), 'bo', 'DisplayName', 'Class 2');

```

        plot(testData(i,1), testData(i,2), 'r', 'MarkerSize', 8);
    else
